## 1 Samandrátt (Abstract)

Í hesum rapporti stendur hvussu vit gjørdur eina kjak heimasíðu, hvat fyri tól-menni (harímillum Ansible, Apache2, MariaDB og PHP) vit brúktu og hvussu arkitektururin var uppbygður til at fremja hetta í verki. Eisini hugdi vit at hvussu front-síðan av heimasíðuni verður tillagur, so at tað er lætt atkomiligt og gevur brúkarinum yvirlit av heimasíðuni.

## 2 Trupulleika-orðing

Hvussu ger man eina kjak heimasíðu sum fólk kunnu vitja og stovna tráðir og leggja innlegg í? Og møguliga eisini hava møguleika at deila media har?

- Man má gera sær greitt at har má vera ein heimasíða, sum fólk kunnu vitja.
- Har má vera ein *backend* har ein dátagrunnur er.
- Har má vera eitt *millumlið* sum tulkar millum *backend* og *frontend* (t.v.s. heimasíðan).
- Har má vera ein *frontend* sum er brúkaraflatan fyri kjak heimasíðuna.

## 3 Mál

- Tað má vera lætt at vita hvar man er og hvussu man kemur fram til brúkarin vil vera.
- Á hesari heimasíðuni skal brúkarin kunna síggja kjaksíður.
  - Fáa yvirlit av kjak undirsíðunum.
  - Fara inn á eina kjak undirsíðu.
  - Síggja tráðir og kunna stovna tráðir.
  - Kunna fara inn á einkultar tráðir og svara í einum tráði og viðmerkja navn, tekstsvor og um tey vilja leggja mynd avtrat.

## 4 Framgangsháttur

Vit byrja við einari stutta analysu hvussu hetta skal fremjast.

- Arkitektur bygnaða av probleminum og hvussu tað fer at síggja út.
- Gera ein databasa í MariaDB har man kann stovna ein *thread* í 3 ymiskum kjakforum har fólk kunnu svara uppá.
- Við einum fullfiggjaðum MariaDB datagrunn, byggja eina heimasíðu sum virkar sum eitt *interface* millum heimasíðuna og datagrunnin.

- *Business logic* millumlið verður brúkt PHP til samskipting millum heimasíðuna og MariaDB.
- Millumliðið fer at avgera hvussu úrslit frá datagrunninum verður víst.
- HTML verður gjørt fyri at fáa grund bygnaðin av síðuni.
- CSS verður nýtt til at pynta HTML og gera snið
- JS leggur síðani funktionlatitet til sum ikki hevur við dátabasan at gera
- PHP byggur dynamiskt síðuna við at taka postar, tráðir, svør úr dátabasanum og leggur teir í HTML á síðuni.

## 5 Design

Figure 1: Samskipti millum heimasíðu og datagrunnin.

Ein Ubuntu Server við einari lokalari heimasíðu og brúkt ein MariaDB dátagrunn at goyma tráðirnar og postar í. PhpMyAdmin verður brúkt til at síggja datagrunnin og tað er installera á sjálva serveran, men er ikki partur av Ansible playbook, tí tað er ikki neyðugt fyri at fáa kjak heimasíðuna at virka.

HTML verður brúkt til at leggja grund til útsjónina, og so at PHP og JS kunnu peika til ávis støð tá heimasíðan verður bygt. CSS verður nýtt til at pynta á HTML, fyri at fáa eina pena og lesiliga heimasíðu. JS verður nýtt fyri at fáa funktionalitet minka og forstørta myndir, og vísa/fjala svar formular. PHP verður brúkt til at dynamiskt byggja lutir av heimasíðuni, sum t.d. postar, svør og tráðir.

## 6 Lýsing av Loysn

### 6.1 Web Uppseting

Lendingar síðan gevur yvirlit av teimum kjakforum sum eru, og leinkir til tey. Brúkarin velur tað forum teimum ynskir, og verður síðani koyrdur har til. Á kjakforum kunnu tey hyggja gjøgnum postar, síggja svør og fara ígjøgnum tráðir, samt sum at leggja egnir postir út ella leggja svar til aðrar postir og onnur svør. Fyri at síggja øll svør má brúkarin fara inn á postin, og um hann ynskir at síggja tráðir undir svørum til postin trýstir hann á ein trád fyri at síggja tann tráðin, og mesta lagið vera víst 10 tráðir per forum og 10 svør per trád. Litir eru valdir

fyri at geva brúkarinum eina róliga kenslu, og grønt er ofta sett í samband við ró. Stórar yvirskriftir og stórir knappar eru valdir fyri at vera lættir at lesa.

Figure 2: Hvussu uppsetingin av forum er.

## 6.2 Databasa Uppseting

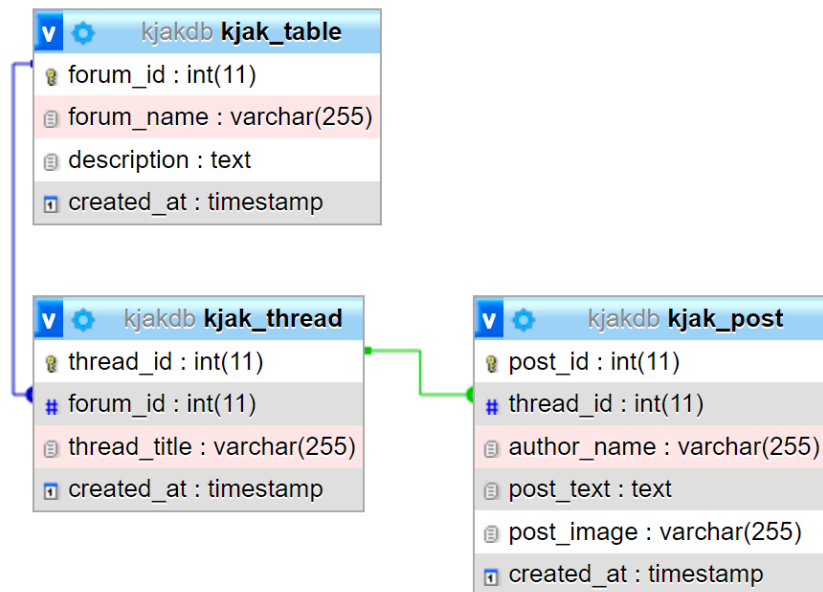

Figure 3: Databasa relatióinirnar fyri *kjakdb*

Databasa relatióinirnar vísa hvussu tær 3 tabelirnar eru relatarar. **kjak\_table** er høvuðs tabellin og hevur *Primary Key* `forum_id` til *Foreign Key* til **kjak\_thread**, og **kjak\_thread** hevur *Primary Key* `thread_id` til *Foreign Key* til **kjak\_post**.

## 6.3 Heimasíðan

Heimasíðan er bert 4 síður við embeddaða PHP kodu til at vísa dáta frá *kjakdb* dátagrunnins 3 tabellir. Annars er ein CSS fil *style.css* fyri uppseting og ein *conn.php* við íbinding upplýsingarnar til dátagrunnin. Eisini er ein JS fil *script.js* fyri interaktivar funktiónir. Tær 4 síðurnar eru:

- *index.php* Heimasíðan sum vísur forumini.
- *view\_forum.php* Undirsíðan fyri at vísa tráðir fyri eitt forum.
- *view\_thread.php* Undirsíðan fyri at vísa ein á tráð og allar svør í tí tráðinum.
- *create\_thread.php* Fyri at stovna ein nýggjan tráð.

## 6.4 Ansible

Hesar 7 fílar (og eisini 8nda *favicon.ico* filin) verða stovnaðir av at koyra kommandoina á einari VM við *Ansible*:

```
ansible-pull -U https://github.com/salomonvjoensen/linuxskipanir.git
```

Tað ekskeverarar eina *Ansible* Playbook **local.yml** á hasum repository sum ger her hesu trin idempotentli (t.v.s. kann vera endurtikið uttan at bróta uppá nakað ella gera óneyðug kopiir):

- Promptar brúkaran fyri -
  - MySQL brúkaranavn.
  - MySQL kodu.
  - kjakdb brúkaranavn.
  - kjakdb kodu.
- Installerar Apache2 og relevant PHP og MySQL modulir, startar Apache2.
- Ger eina *uploads* mappu í */var/www/html/uploads*
- Slettir *index.html* filuna (um hon er til).
- Tær 7 fílar kopieraðar yvir til *html* mappuna.
- *conn.php.j2* template filin við kjakdb brúkaranavn og kodu verður framleitt og stovna.
- **MariaDB** tænasta verður stovna og byrja.
- **Pip** og **PyMySQL** verða installera.
- Stovna *MySQL brúkan* og *root brúkan* (við sama MySQL kodu)
- Stovna *kjakdb* dátagrunnin.
- Stovna *kjakdb brúkan* fyri dátagrunnin.
- Koyra eitt *bash* script til at dagføra dátagrunnin við teim 3 tabellir og 3 forum INSERT.
- Seinast seta eitt *setup flag* til, so man verður ikki promptaður eina aðru ferð man koyrir hesa **Ansible playbook**.

Aftaná kann man opna localhost í ein kagara og Kjak heimasíðan er uppi og koyrir.

## 7 Perspektivisering

Heimasíðan hefur tað mest einklu treytirnar fyri at vera hugsa sum ein kjak-heimasíða, Sígga nøkur forum, tráðir, stovna tráðir, svara á tráðum og leggja myndir út saman við svør.

Tað er ein einkul kjak heimasíða, sum kundi verið nógv útbygt, mest sannlíkandi kundi verið at vitjandi kundu stovna brúkarar (um tey vildu), so tey sjálvu kundu strika teirra egnu tráðir og svør. Ting sum at indeksa heimasíðuna, so man kundi leita uppá dátagrunnin kundi eisini verið implementera.

Tað er skjótt at fáa heimasíðuna upp at koyra bara við einari einklari bash kommandoina, og 4 promptir har man kann seta sjálv(ur) hvat fyri brúkaranøvn og kodir man vil brúka, givið man hefur **Ansible** á einum Linux líknandi umhvørvi (vit brúktu Ubuntu Server VM), og tað vísur eisini styrkina í **Ansible**.

Vit hugsaðu um at brúka **Ansible Playbook**, so man kundi havt forriti koyrt á fleiri umhvørvum men hvat er meiningin at hava fraktuera kjak á nógvum støðum, tá man kann hava eitt samla stað at kjakast í?

## 8 Niðurstøða

Okkara arbeiði og skeið gav okkum innlit hvussu man brúkar Linux umhvørvi og hvussu tað er at arbeiða næstan bara í einum terminal uppseting. Nógvar kommandoir skuldi man læra, og brýtir nógv frá tí vanda GUI umhvørvi man kennur mest frá Windows, men um man dugir kann man automatisera øgiliga nógv og næstan hálv-forrita redigering av fílum, her hugsi eg um *vim* editorin.

Kjak heimasíðan er einkul, men tøkkin aftanfyrir er sørmi ikki. Man kundi sett upp heimasíðuna uttan at hava **Ansible**, men tað hevði kravt nógv manuelt arbeiði hvørja ferð man skuldi sett upp eitt nýtt kjak heimasíðu umhvørvi aðra staðnis.

## 9 Appendix

### 9.1 Tíðarætlan

Figure 4: Skermmynd tikin av tíðarætlan mánadagin 12. februar 2024

Fyrst var dátagrunnurinn designaður, so bleiv PHP kodan koda til dátagrunnin. Meðan tað varð arbeiða uppá tað byrjaðu vit so smátt at skriva rapportina og gera tað seinasta hondverki av HTML, CSS & JS uppseting av heimasíðuna, bara so hon sær eitt sindur vøkur út.
